MEASURING CONDITIONS

All DC voltages are measured relative to ground with voltmeter (inner resistance 10 Mohms).

DC voltages are stated in volts (V), ex.: 0.7 V.

Oscillograms and AC voltages are measured relative to signal ground with oscilloscope or voltmeter with an input resistance of 1 Mohm.

AC voltages are stated in millivolt (mV), ex.: 725 mV.

Voltages on the FM and AM. section are measured without signal in position P6 - FM.

Voltages on the turntable section are measured in position PH(33 r.p.m.).

Voltages on the tape recorder section are measured in position TP, play back, (333 Hz, 250 pWb mm).

Signal paths are shown for AM (position MW) and FM and for AF right channel.

The tape recorder signal path in recording position is shown in right channel, and replay position is shown in left channel.

Mechanical switches are shown in neutral position.

EXPLANATION TO DIAGRAM

Because of the large number of internal connections in the set the wire connections have been gathered into »bundles« in the diagram. The individual wire is provided with codes indicating where they lead to. This principle is also applied in Bang & Olufsen's CTV diagrams.

INTERNAL CONNECTION ON A DIAGRAM PAGE

indicating by two identical letters (capital or small).

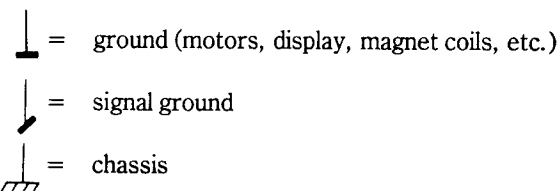

CONNECTION TO ANOTHER DIAGRAM PAGE

indicated by a letter (capital or small) and a diagram (D) number or by a small and a capital letter together with a diagram (D) number.

GROUND SYMBOLS

Three different ground symbols are used in the set.

TP0

In the power supply on PC3 is stated a ground test point TP0. In this and only in this test point ,  and  are connected to each other.

TP0 may therefore be used as reference for both DC measurements and signals measurements in the set. However, in connection with fault finding on the various modules the ground of the module in question should always be used as reference.

TP0 is used as reference at measurements of DC voltages from the power supply (PC3-4).

CO-ORDINATE NUMBERS

The biggest PC boards are provided with co-ordinate systems. The components on these PC boards are provided with a co-ordinate number on the diagram (smaller printing type than the position numbers) indicating in which co-ordinate they are placed on the PC board.

The co-ordinate numbers for the left channel of the output amplifier are stated in brackets in the diagram for right channel.

ADJUSTMENT OF NO-SIGNAL-CURRENT

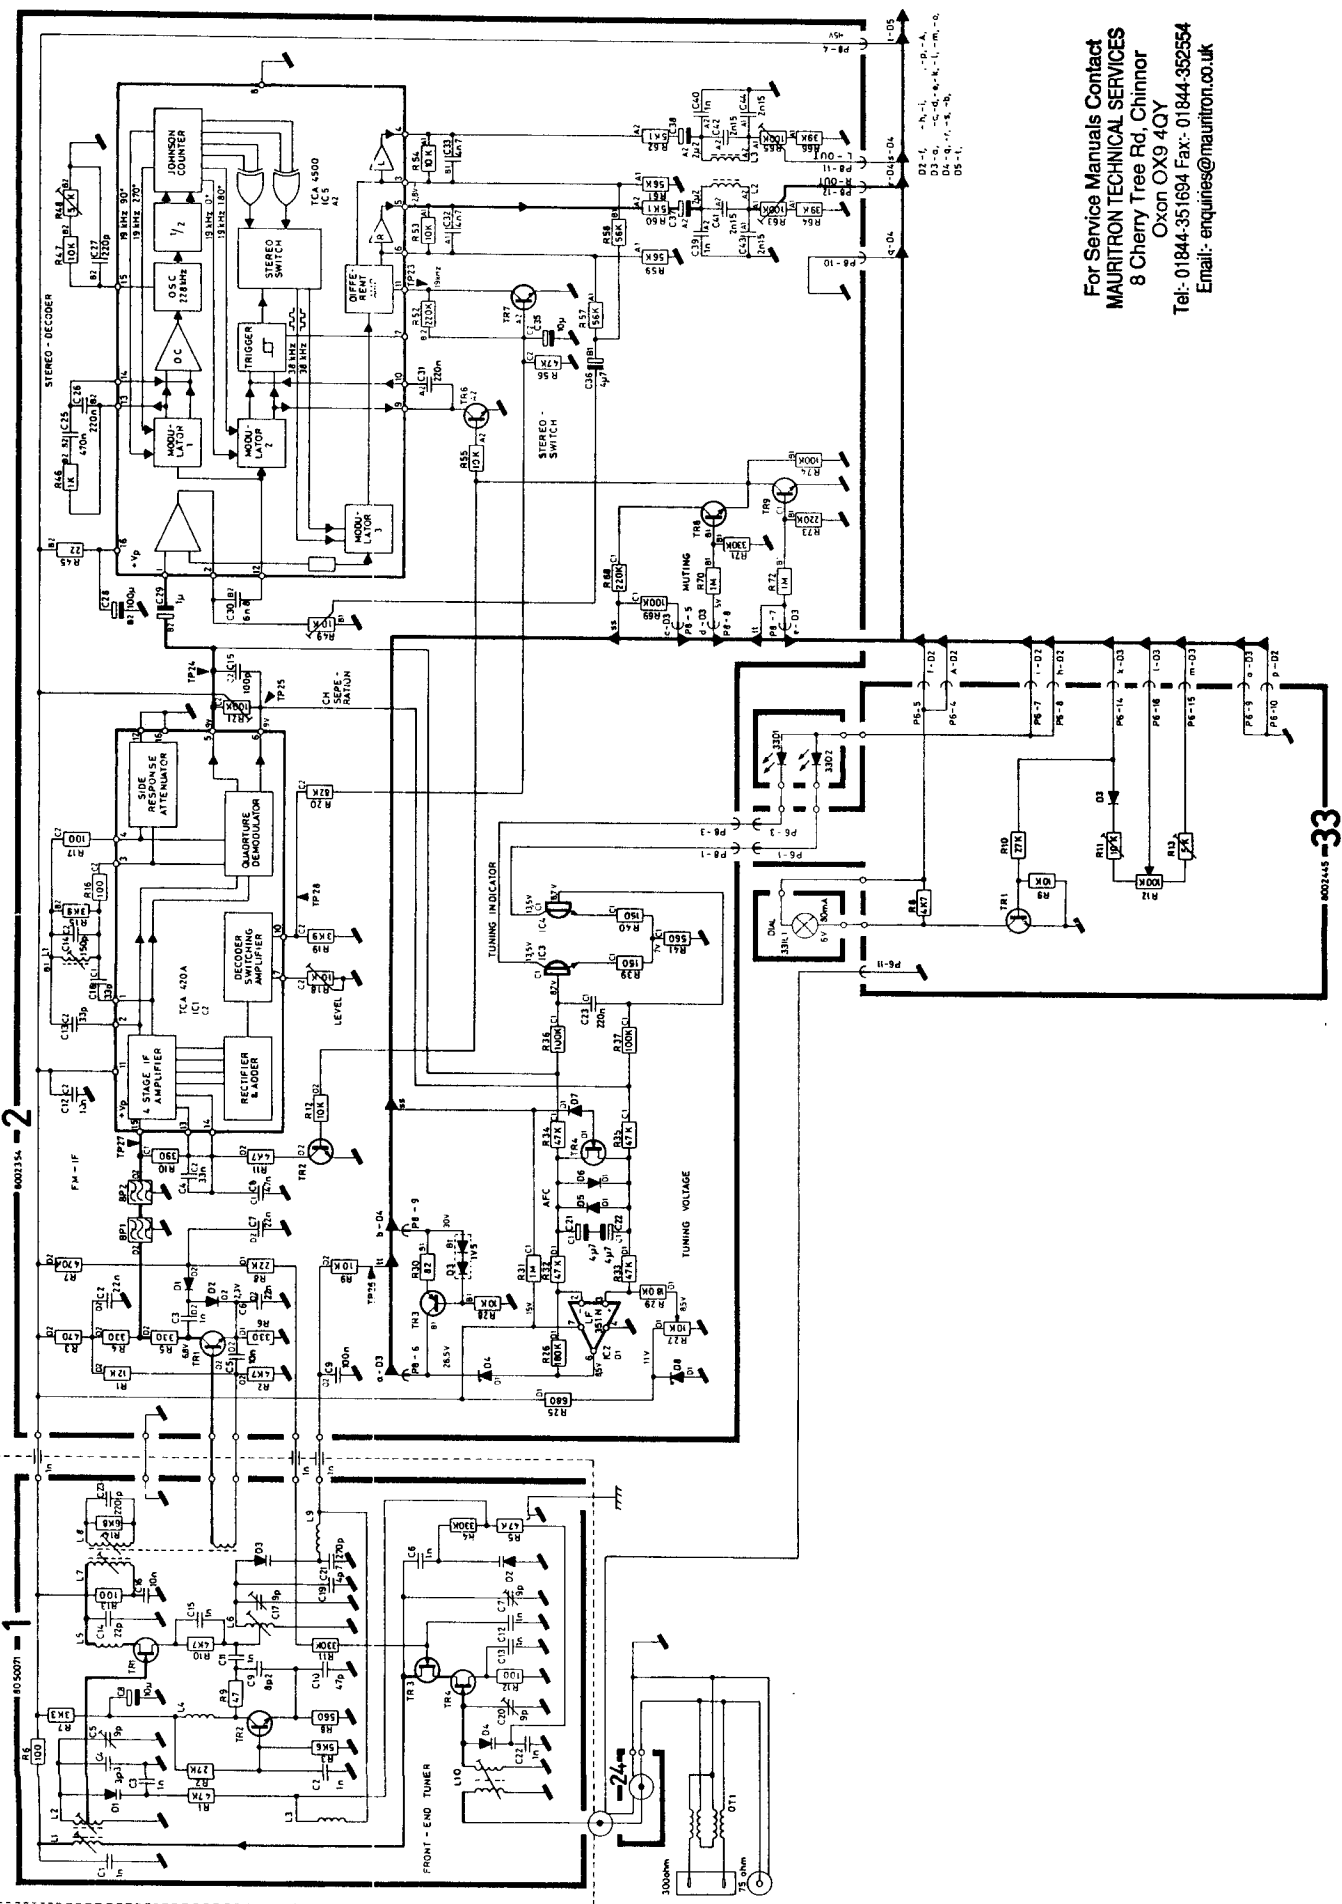

Adjust no-signal-current with receiver cold and volume control turned down. **SPEAKERS MUST NOT BE CONNECTED.**

With 3R224 (3R124) adjust to 10 mV DC measured across emitter resistor 3R226 (3R126) TP200/TP201 (TP100/TP101), or adjust to 25 mA in collector of 3IC200 (3IC100).

Symbol for safety resistors

When replacing components with this symbol use the same type and the same values for ohms and watts. The new components is to be mounted in the same way as the replaced.

RADIO SECTION ADJUSTMENTS 6.5 V Power Supply

Switch to ST BY.
Connect DC voltmeter between 3TP0 and 3TP9.
With 3R12 adjust voltage to 6.5 V \pm 0.1 volt.

No-Signal Current

Select P1 – P5.
No-signal current should be adjusted with the receiver cold and with the volume control turned all the way down.
Speakers must not be connected.
Connect DC millivoltmeter between 3TP200 and 3TP201 (3TP100 and 3TP101), or a mA meter in the collector of 3IC200 (3IC100).
With 3R224 (3R124) adjust for 10 millivolts, or 25 mA.

Gain (AF)

Switch to P1 – P5.
Volume control at max.
Bass, treble and balance controls at neutral.
Connect tone generator to external tape input and set it to deliver 1 kHz – 140 millivolts.
Connect AC voltmeter to speaker output.
With 5R41 adjust voltage to 12.7 volts in left channel and with 5R38 adjust to 12.7 volt in right channel. (12.7 volts represents 40 watts at 4-ohm load).

FM – Presetting of Potentiometers

When performing total readjustment of the FM section it will be an advantage to preset the potentiometers as follows:
2R21 and 2R27 should be set at midscale.
2R18, 2R49, 2R63 and 2R65 should be turned fully clockwise.

Tuning Voltage

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
 8 Cherry Tree Rd, Cninnor
 Oxon OX9 4QY
 Tel: 01844-351694 Fax: 01844-352554
 Email: enquiries@mauritron.co.uk

Switch to P6 – FM.

Adjust 2R27 to 27.5V measured on P8 pin 6.

Adjust 22R19 to 4V measured on P6 pin 15.

Set dial to 89 MHz, adjust 23R9 (* 33R13) to 5.6V measured in 2TP26.

Set dial to 106 MHz adjust 23R8 (* 33R11) to 21.0V measured in 2TP26.

* Adjustment of 33R13 and 33R11 applies for type 1802.

Tuner

Select P6 – FM and tune to 89 MHz.

Connect sweep generator to aerial input and set to 89 MHz.

Connect oscilloscope through RC probe to 2TP28 (pin 10 of 2IC1) or through diode probe to 2TP27 (pin 15 of 2IC1).

With 1L6, 1L1, 1L2 and 1L10 adjust for max. and symmetrical IF curve.

Now set the dial pointer to 106 MHz and the sweep generator to 106 MHz.

With 1C17, 1C7, 1C5 and 1C20 adjust for max. and symmetrical IF curve.

Check dial accuracy. Repeat adjustment if necessary. Now set dial pointer to 94 MHz and sweep generator to 94 MHz.

With 1L7 and 1L8 adjust for max. and symmetrical IF curve.

Detector

Select a dial setting of e.g. 94 MHz. Connect a signal generator (or perhaps a stereo coder); this should be set to the same frequency. Switch off AFC on the set.

Connect DC voltmeter to 2TP28.

Applying a low input signal, set the tuning control for min. DC voltage at 2TP28.

Connect wattmeter or AC voltmeter to AF output.

Increase input signal (1 millivolt), and adjust 2L1 for max. AF output (thereafter, if required, for min. distortion).

Connect DC voltmeter between 2TP24 and 2TP25 (pins 5 and 6 of 2IC1).
Adjust 2R21 for 0 V.

Stereo decoder

Tune in to a mono station.
Connect frequency counter to 2TP23.
Adjust 2R48 for 19 kHz \pm 50 Hz.
(2R48 may also be adjusted by applying 19 kHz from 2TP23 to the Y-input of an oscilloscope and 19 kHz from a stereo coder to the oscilloscope's X-input. When the Lissajous figure is stationary, adjustment is correct.
A third adjustment procedure consists in tuning in a stereo signal on the receiver. Turn 2R48 to one side until the stereo effect ceases and thereafter to the other side until the stereo effect ceases. The intermediate setting between these two settings is approximately the correct adjustment).
Connect stereo coder to aerial input. AFC ON.
Connect wattmeter or AC voltmeter to AF output. With 2R49 adjust for min. signal in unmodulated channel.
Adjust input signal to 30 microvolts.
Adjust 2R18 for channel separation of between 25 dB and 15 dB.

FM Level Adjustment

2R65 (left) and 2R63 (right) are factory pre-adjusted for max. output, but the AF signal from the FM section can be attenuated with these adjustments should this be found necessary.

AM-IF

Set the receiver to e.g. 575 kHz in the MW band.
Apply signal from the sweep generator to 23TP21 through 0.1 μ F, centre frequency 469.5 kHz Δ 10 kHz (the 468 kHz resonators in the circuit used provide a centre frequency of approx. 469.5 kHz \pm 1.5 kHz).
Necessary RF voltage is approx. 10 millivolts (due to IF suppression in the IC),
However, it is recommended to stop the oscillator by connecting a 0.1 μ F capacitor between pin 15 of 23IC1 and chassis potential as this will result in a considerable reduction in IF suppression. Necessary RF level will then be 100 μ V. It is recommended to use as weak a signal as possible to avoid influence from the AGC.
Connect oscilloscope to 23TP29 (pin 6 of 23IC1). Adjust 23L6 and 23L7 for maximum and symmetrical IF curve.
Remove oscillator stop.

MW Oscillator and Signal Frequency Circuits

Connect signal generator to aerial through dummy aerial 575 kHz, modulation 30% - 400 Hz or 1 kHz.
Connect wattmeter or AC voltmeter to AF output. Set receiver to 575 kHz.
With 23L4 adjust the oscillator so that the receiver is tuned exactly to the transmitter frequency. (Use weakest possible signals throughout the adjustment procedure as this will result in the most precise adjustment).
With 23L2 adjust for max. signal at AF output.
Set signal generator and receiver to 1495 kHz.
With 23C13 set oscillator to frequency.
With 23C4 adjust signal-frequency circuit for max. signal.
Repeat adjustments until dial calibration matches correctly and signal-frequency circuits is at max.
Lastly adjust 23C4.

LW Oscillator and Signal Frequency Circuits

Set signal generator and receiver to 155 kHz.

With 23L3 set oscillator to frequency.

With 23L1 adjust signal-frequency circuit for max. signal.

Set signal generator and receiver to 285 kHz.

With 23C8 set oscillator to frequency.

With 23C2 adjust signal-frequency circuit for max. signal.

Repeat adjustment until dial calibration matches correctly and signal-frequency circuit is at max.

Lastly adjust 23C2.

For Service Manuals Contact

ELECTRICAL ADJUSTMENTS TAPE RECORDER

References apply to right channel (Braketed references apply to left channel).
Electrical adjustments to be made without DOLBY NR.

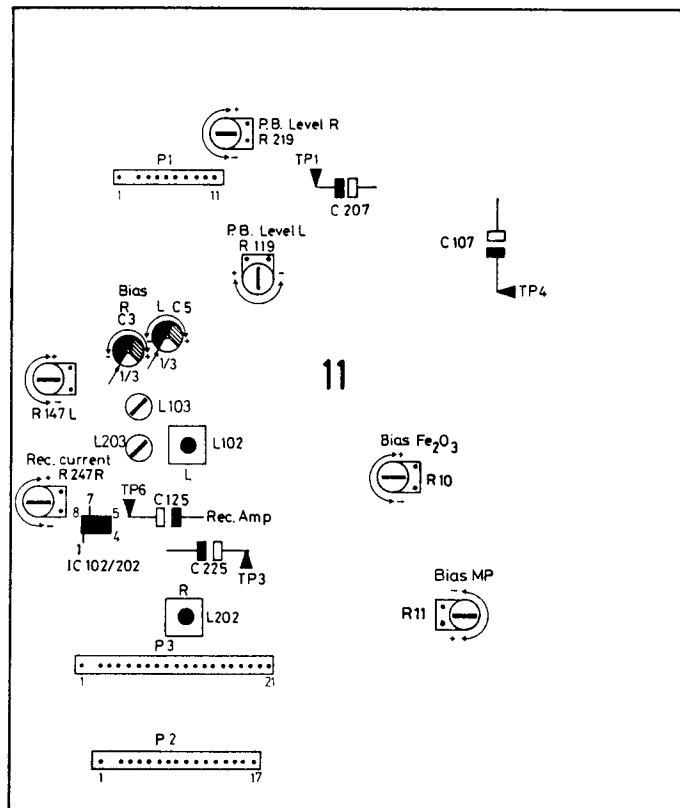

Azimuth

Demagnetise tape head and erase head.
Connect LF voltmeter to 11TP3 (11TP6).
Insert azimuth tape 6780036.

Adjust screw A for max. signal in both channels and for equal output for left and right channels (mean valut 11TP3 (11TP6)).

Playback level

Insert Pegel tape 6780035 in cassette holder.
Connect LF voltmeter to 11TP3 (11TP6).
Adjust 11R219 (11R119) so that 725 millivolts is measured at 11TP3 (11TP6).

Speed

Insert wow tape 6780037 in cassette holder.
Connect wowmeter to 11TP3.
With potentiometer A in motor adjust for correct speed as read on the wowmeter's driftmeter.
Adjustment to be amde in the middle of the tape.

Record Boost

 Email:- enquiries@maurtron.co.uk

Insert CrO₂ tape.

Connect tone generator to tape input and set to deliver 333 Hz in the 1-Volt range.

Activate record pause.

Adjust record potentiometer so that 316 millivolts is measured at pins 1 and (7) of 11IC202 (11IC102).

Set tone generator to 10 kHz.

Adjust 11L202 (11L102) so that 1 volts is measured at pins 1 and (7) at 11IC202 (11IC102).

Bias filter

Activate Record.

Adjust 11L203 (11L103) to maximum voltage, measured across the tapehead.

Bias and Record Current CrO₂

Insert CrO₂ tape 6780040 for which bias adjustment is desired set 11R247 (11R147) to midscale and 11C3 (11C5) to one-third of full scale.

Record Current

Connect tone generator to tape input and set to deliver 333 Hz in the 1-volt range.

Activate record pause.

Adjust record potentiometer so that 200 millivolts is measured with LF voltmeter at 11TP3 (11TP6).

While recording and playing back, respectively, adjust 11R247 (11R147) so that 200 millivolts is measured at 11TP3 (11TP6) during both record and playback.

Bias

Set tone generator to deliver 333 Hz in 100-millivolt range.

Adjust record potentiometer so that approx. 25 millivolts is measured with LF voltmeter at 11TP3 (11TP6).

While recording and playing back 333 Hz and 15 kHz, respectively, adjust 11C3 (11C5) so that the level at 15 kHz is 1 dB higher than the level at 333 Hz (less bias gives treble boost; more bias gives treble cut).

Check record current.

Fe₂O₃ Bias

CrO₂ must be adjusted, and tone generator and potentiometer settings must be the same as for CrO₂ bias.

Insert Fe₂O₃ standard tape 6780043.

While recording and playing back 333 Hz and 15 kHz, respectively, adjust 11R10 for identical levels at 333 Hz and 15 kHz as measured with LF voltmeter in 11TP3.

MP Bias

CrO₂ bias must be adjusted, and tone generator and record potentiometer settings must be the same as for CrO₂ bias.

Insert MP test tape 6780059.

Activate METAL TP.

While recording and playing back 333 Hz and 15 kHz, respectively, adjust 11R11 till the level at 15 kHz is 1 dB higher than the level at 333 Hz, measured with LF voltmeter in 11TP3.

MECHANICAL ADJUSTMENTS

Erase Head Height

Erase head heights is adjusted with adjustment tools 1 and 2 from adjustment tool kik 3624020.

Plade adjustment tools in cassette holder as shown in sketch.

Carefully press tape head bridge in against tool 2.

With screw A adjust until tape guide goes in above tool 2.

Rewind

Press armature in magnet coil 12RL4 in as far as it will go.

Clearance between arm A and arm B should then be 0.5 – 1 m. Adjustment is preformed by bending the arm A so that tag C moves in one of the directions of the arrow.

Thrust Roller Free Travel

Press tape head birdge as far as it will go. Clearance between pin A on thrust roller arm and tape head bridge should then be approx. 0.5 mm.

Adjustment is performed by bending pin A.

Thrust Roller Thrust

Activate play.

With spring balance at point B pull thrust roller back.

Carefully release thrust roller until it just touches the capstan shaft.

Shift spring C to one of the two notches where the spring balance reading is closest to 300 p.

Example: Spring in right-hand notch gives 280 p and spring in left-hand notch gives 330 p. Since ideal force is 300 p right-hand notch is correct adjustment.

Eject Switch

Carefully push arm A in direction of arrow, eject switch B should then open from travel of from 0.5 mm to 2 mm and before the cassette drawer releases mechanically.

Cassette Detector
Record Lock

The two switches for cassette detector and record locking are bent back at the points »B« so that the switches change-over reliably when a cassette is inserted, and will change back again when the cassette is removed.

Assembler Moment

The assembler moment should be within 35/60 p/cm.

Adjustment is made by pressing the ring »B« of the assembler coil all the way down and turn it.

ADJUSTMENTS
RECORD PLAYER
Speed

Remove the turntable so that the adjustment holes are accessible.

33 r.p.m./min. should be adjusted first. Adjust with 17R22.

45 r.p.m./min. is adjusted with 17R20.

Speed may be checked in two ways:

1. Stroboscope disc and lamp connected to the mains. This check gives an inaccuracy of approx. 2% because the 50 Hz mains frequency deviates approx. ± 1 Hz.
2. Stroboscope disc and stroboscope lamp's tolerance which normally is superior to that of the mains frequency.

Turntable height

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES

Tel: 01844-351694 Fax: 01844-352554
Email: enquiries@mauritron.co.uk

Remove covers from screws A.

Place turntable and two LP records of normal weight on the motor. The motor should then clear all three transit bushings E (see points B).

The turntable should likewise be parallel with the chassis deck, and when the two LP records are removed from the turntable, distances C and D should be approximately identical.

Adjustments are made with screws A.

Pick-up height

Put a record on the turntable.
 Position the pick-up arm above a run-off groove.
 Adjust screw A until the distance from the stylus to the record is 5 mms.
 This adjustment must be made with a counterbalance weight mounted.

Pick-up arm balance

Turn the counter-balance weight until pick-up arm is in balance.
 Hold the counter-balance weight in this position and zero the dial B.
 The counter-balance weight A is turned clockwise until the dial B shows the stylus pressure required (for MMC 20" it is 1.5 grams).

Pick-up arm parallelism

Loosen the screw C and turn the pick-up arm until the A and B clearances are equal and the straight section of the pick-up is parallel to the topside of the record.

Pick-up arm lowering

When playing a record the tap B is adjusted so that the pick-up arm positively clears the holder C.

Antiskating

Put the test record 3621045 on the turntable.
 Set stylus pressure to 1.5 grams with MMC 20S.
 Play cut 1.
 Connect an oscilloscope to the RH and LH channels.
 Push stud B in either direction of the arrow A until there is an equal distortion in both channels (for LH channel distortion, slacken spring C, tighten for RH channel distortion).

Automatic record-size mechanism

Take off turntable.

Place 60-gram weight on centre adaptor (60-gram and 20-gram weight kit 3624024).

Start turntable.

The centre adaptor should then be capable of lifting the weight, and the pick-up arm should travel in to 17-cm lowering.

Adjustment can be made with screw A. Turn screw A anticlockwise for greater lifting power and clockwise for less lifting power.

Place weights of 60 and 20 grams on the center adaptor.

Start turntable.

The centre adaptor should then be incapable of lifting the weights, and the pick up arm should travel in to 30-cm lowering.

Adjustment should likewise be made with screw A.

Pick-up arm lowering

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
 8 Cherry Tree Rd, Chinnor
 Oxon OX9 4QY
 Tel: 01844-351694 Fax: 01844-352554
 Email: enquiries@mauritron.co.uk

Pick-up arm lowering can be adjusted both from above and from below.

The adjustment described here is made from above.

Take 60-gram weight on centre adaptor.

Start turntable.

With eccentric A adjust until pick-up arm lowers inside the field marked 17 cm in the accompanying drawing.

Place 60- and 20-gram weights on the centre adaptor.

Start turntable.

With eccentric B adjust until the pick-up arm lowers inside the field marked 30 cm in the accompanying drawing.

When making the adjustment from below, a single record (17 cm) and an LP record (30 cm) may be used instead of weights.

Motor switch (15RL1)

When the Motor switch is open (the armature of the mechanical relay in its mid-position) the clearance between the C and D sections of the switch should be 0.5 – 1 mm. This is adjusted by bending the D-section of the switch.

When the Motor switch is closed, the C-section of the switch should press at approx. 15 p in the direction of the arrow. This is adjusted by bending the C-section of the switch.

TECHNICAL SPECIFICATIONS

Amplifier

Power output RMS DIN	2 x 40 watts/4 ohms
	2 x 30 watts/3 ohms
Power output 20-20.000 Hz	2 x 30 watts/4 ohms
	2 x 25 watts/8 ohms
Harmonic distortion -26 dB	<0.1%
Harmonic distortion	<0.1%
Intermodulation	<0.3%
Frequency range ± 1.5 dB	20-30.000 Hz
Power bandwidth	10-50.000 Hz
Damping factor	>25
Input tape copy	150 mV/470 kohms
Input microphone	0.1 mV/470 ohms
Signal-to-noise ratio phono	>82 dB
Signal-to-noise ratio tape	>82 dB
Channel separation 1000 Hz	>50 dB
250-10.000 Hz	>35 dB
Output headphones	Max. 20V/200 ohms
Bass control at 40 Hz	± 11 dB
Treble control at 12.500 Hz	± 11 dB

FM

FM range	87.5-108 MHz
FM aerial impedance	75/240 ohms
FM sensitivity stereo 46 dB	<25 μ V/75 ohms
Frequency range ± 15 dB	20-15.000 Hz
Harmonic distortion	<0.4%
Stereo channel separation	>35 dB

AM

AM sensitivity LW/MW	<100/80 μ V (only type 1804)

Subject to change without notice

DISMANTLING
Operation section

Remove screws A and B. Lift the back edge of the unit approx. 10 cms (4") and disconnect the internal connections for loudspeakers and aerial.

The operation chassis can now be lifted into servicing position on the support mounted on the inside of the cabinet.

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel: 01844-351634 Fax: 01844-352564
Email: enquiries@mauritron.co.uk

The loudspeakers can be connected direct to the wires from the output amplifier.

Record player section

Remove screws C and D when the operating section has been lifted into servicing position. Now lift the back of the record player into servicing position just like the control section.

SERVICE TIPS**Measurement of defective output amplifier**

Should a fault arise in an output amplifier resulting in DC on the loudspeaker output, the fault switch circuit will put the set in STAND-BY. The connected loudspeakers must then be disconnected and the set can now be turned on and measurements be made unless there is a direct short-circuit in the output transistors.

Replacing dial lamp

The AM module is removed. The dial housing is pushed in the direction of the arrow (A). The cover (B) can now be opened and the lamp replaced.

After replacement the dial housing is pushed back into its original position.

Removal of servicing hinges

If removal of the operation chassis and the record player chassis is required, the hinges can be removed by twisting with a broad and strong screwdriver under the hinge.

Dial drive

Dial cord (index No. 3955016) is cut off at a length of approx. 60 cms (23½") and knotted at both ends with 55 cm (21¾") between the knots. The tuning capacitor is turned counter clockwise and the cord is fitted as shown in the drawing.

Cabinet repairs and panel replacement

The cabinet kit consists of a set of veneer panels with a back coat of self-adhesive tape and protective paper.

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
 8 Cherry Tree Rd, Chinnor
 Oxon OX9 4QY
 Tel:- 01844-351094 Fax:- 01844-352554
 Email:- enquiries@mauritron.co.uk

The easiest way to remove the old panels is to heat them with a hot air blower (hair drier) and slowly to peel the old veneer panels off. It is advisable to follow with a Stanley-type knife along the edge of the foam chassis while peeling the veneer off.

If the adhesive coat is intact after panel removal the new panels may be fitted direct on top of the old coat of adhesive. If, however, the old coat is rough it must be removed with benzine prior to the fitting of the new panels.

The side panels must be stuck on first and in such a way that they flush with the front edge. The front panel must be stuck on so that one corner fits the side panel after the mounting, the second corner must be cut flush by using a sharp Stanley-type knife or a mortise chisel.

Wow frequencies

Frequency	Source of Failure	pos. No.
1,1 Hz	Thrust roller	12049
1,3 Hz	Take-up reel	12044
4,3 Hz	Drive belt	12162
4,5 Hz	Take up belt	12140
5,2 Hz	Idler wheel	12041
6,0 Hz	Flywheel	12161
11,8 Hz	Cluth	12135
36,5 Hz	Pulley	12101

INSULATION TEST**Insulation test for
Beocenter 5000**

Each set **must** be insulation tested after dismantling. The test is to be performed when the set has been re-assembled and is ready for delivery to the customer.

Make the insulation test as follows:

Short-circuit the two plug pins of the mains plug and connect one of the terminals of the insulation tester. Connect the other terminal of the insulation tester to the chassis pin of one of headphone sockets.

N.B.!

To avoid rouining the set, it is essential that both insulator test terminals are in really good mechanical contact.

Now turn slowly the voltage control of the insulation tester until a voltage of 1.5 – 2 kV is obtained. Hold it there for 1 second, then turn slowly the voltage down again.

At no point during the testing procedure any flash-over are permissible.
