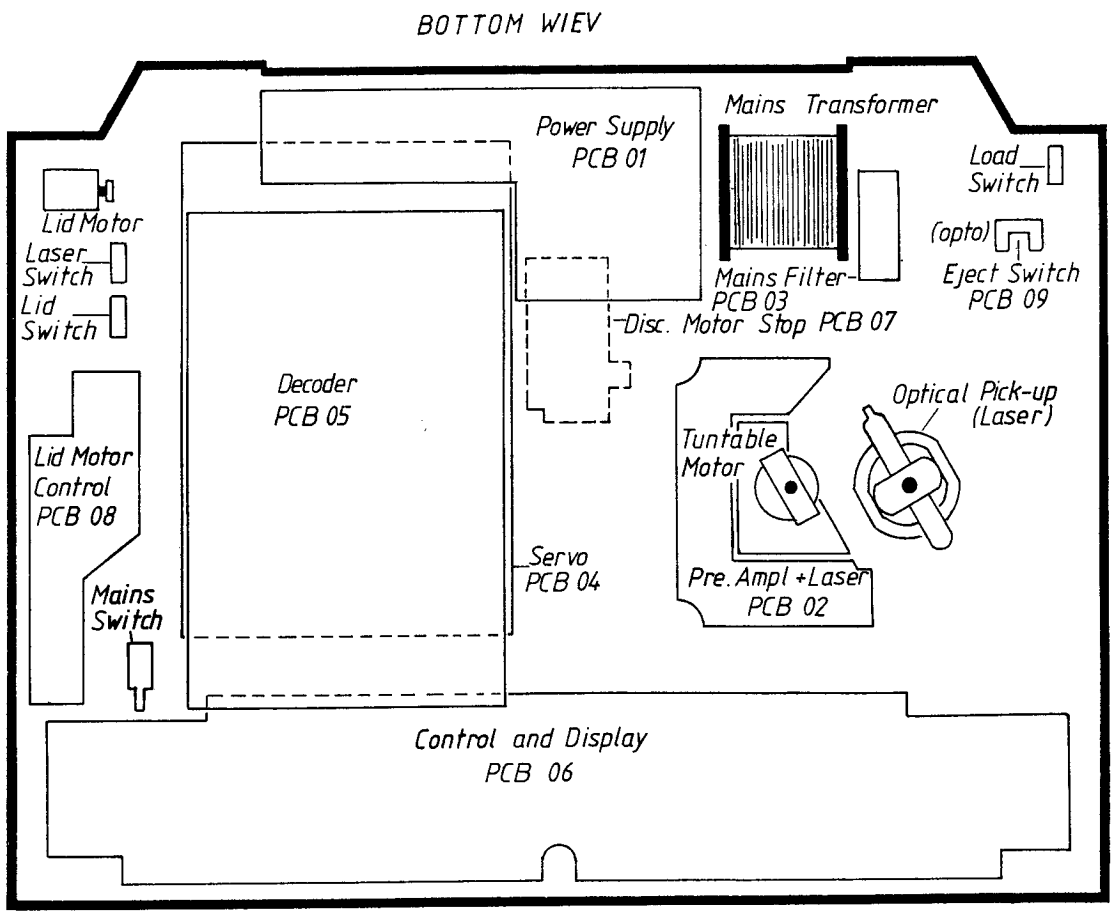
SERVICE MANUAL



CAUTIONS

The light pin is much more sensitive to static charge than a MOS IC. Careless treatment during servicing may reduce life expectancy drastically. For this reason care should be taken that during servicing the potentials of the aids and yourself equal the potential of the mechanism.

The CD-mechanism is provided with self-lubricating bearings and should thus NOT be lubricated.

Attention:
To prevent adjustments in the mechanism from changing, no screws other than those mentioned should be loosened.

Ensure that the player is not resting on the shaft of the turntable motor or the light pin during repairs and measurements.

Symbol for Safety Components

When replacing components with this symbol components with identical part numbers are to be used. The new component must be fitted in the same way as the one replaced.

For order to make the product work when placed in service position, see page 7 dismantling.

DIAGRAM EXPLANATION

The respective diagrams are named, e.g. SERVO 1. The cable connections between the diagrams are described by the name of the diagram to which the connection goes, as well as by the socket and pin number (or a designation) on the diagram in question.

System of co-ordinates

The most closely written diagrams and PCB drawings are provided with a system of co-ordinates.

The position numbers with attached co-ordinate designation can be found at the top of the diagram pages and next to the PCB drawings.

Switch survey

When the top lid is closed, the switches are in the following positions:

LOAD is off
LASER is on
LID is on
EJECT pin 12 of IC6078 is high

When the button EJECT is presse, the following things happen:

LOAD goes on, then EJECT pin 12 of IC6078 goes low as long as the button is pressed. As the lid opens, LASER goes off, and when the lid is in its upper position, LID goes off.

Lubrication

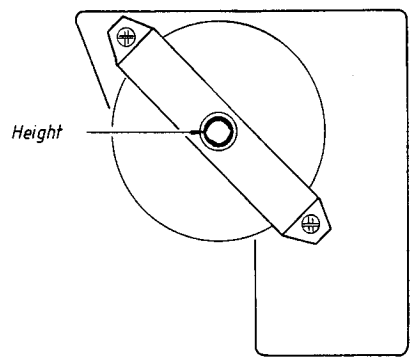
1. Arm 9011 sliding surface towards 9013
   Bracket 9007 sliding surface towards 9013
   Silocone paste P4

2. Arm 9008 sliding surface towards 9007 Isoflex PDL250

MECHANICAL ADJUSTMENTS

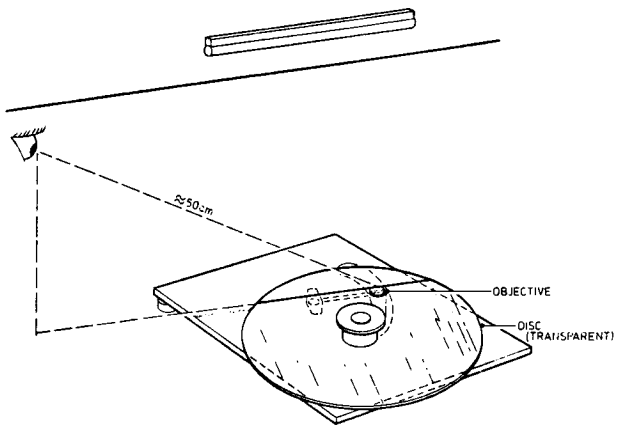
Height setting of the turntable

For this alignment the unit should be in the position of normal end use.
The servicing supports 3634027 can be used here.
Playback track 1 of disc 3634031. (Disc without defects).
Connect a DC voltmeter between the *negative* of the focus motor and earth of the preamplifier print.
Adjust the height of the turntable with bearing screw in such a way, that the voltage is 0 V ±100 mV. Seal hereafter the screw with sealing paint.



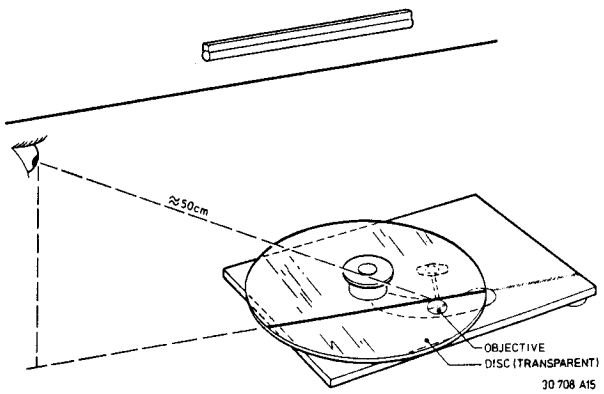
Checking the angle setting

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk



Place mirror 3634029 on the objective and glass disc 3634040 (with disc hold-down 3634032) on the turntable.

Locate the unit under a light source and under this light source a straight line should run (e.g. fluorescent tube with grid).
Set the arm to mid-position. Turn the unit until the arm is parallel to the line under the light source (see fig.).
Look in the direction and in the prolongation of this line to its reflection on glass dics and mirror.
These lines should not be more than 4 mm apart:
Position the set in such a way that one line runs across the centre of the mirror. When the other line remains inside the mirror's surface, the distance is ≤4 mm.



Rotate the CD mechanism through 90° relative to the previous position.
The arm must be kept in mid-position (see fig.).
Repeat the previous measurement.

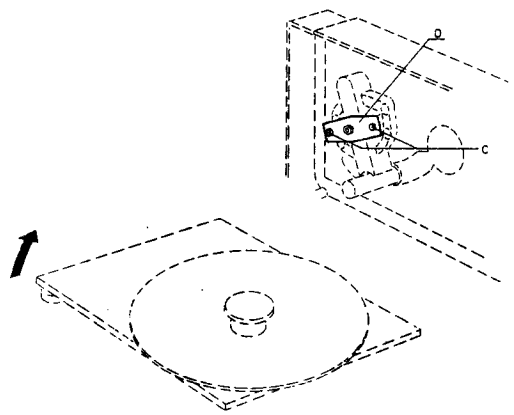
Adjusting the angle setting

With respect to the adjustment of the angle between disc and light path, the factory has looked for a compromise between minimum angle deviation and minimum arm friction.
In the measurements show that the angle falls outside the tolerance given, the angle should *not* be adjusted for minimum deviation, but just within tolerance. The new setting should lie between the "old" setting and the optimum setting.

After adjustment, the friction of the arm should be checked. This is done by means of a spring-pressure gauge which is connected to the counter-weight. The friction of the arm, measured over the total schanning deflection, is not allowed to exceed 30 mN.
When the friction appears to be too high, the angle should be reset to its old value. Then replace the arm by a new one and check the angle once more.

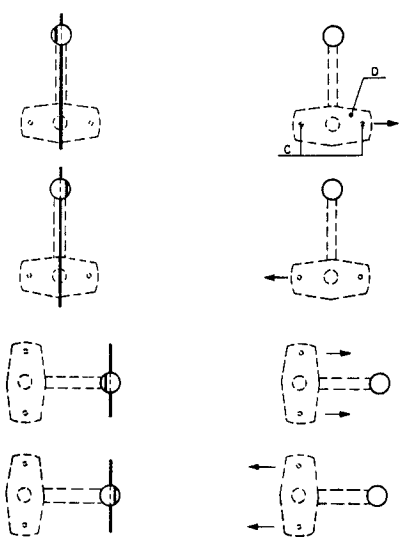
Adjustment of the angle is performed as follows:
Place the set on the servicing supports 3634027.

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk



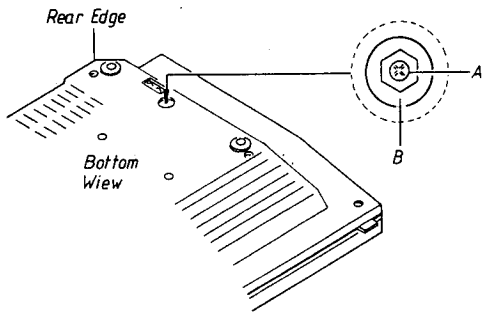
Loosen screws C (see fig.) until bearing plate D can be shifted.
Correct the angle setting by shifting the bearing plate in the direction indicated on the figure.
Tighten screws C ensuring that the setting does not drift. **Double check** the angle setting in two directions.

ATTENTION!
After setting the angle, the height setting of the turntable should be checked.



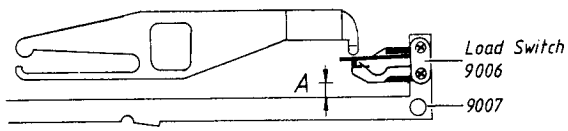
Height adjustment of lid

Before undertaking the height adjustment the set must be *fully* assembled, and the adjustment is made through a hole in the bottom plate of the set.



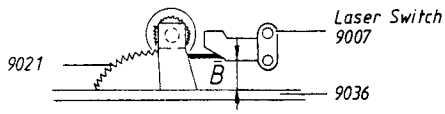
Loosen holding screw A.
Adjust the bushing B, using a 6 mm hexagon spanner, until the lid is flush with the upper edge of the control panel (±0.5 mm).
Tighten the screw A.
In case the adjustment is not within the tolerance range, this may cause failure of function in the eject system.

Load Switch



When fastening the load switch 9006, make sure the distance A between the lower part of the switch and the bracket 9007 is 3.4 mm.

Laser Switch



When fastening the laser switch 9034 make sure the distance B between the lower part of the switch and the bracket 9036 is 6.8 mm.

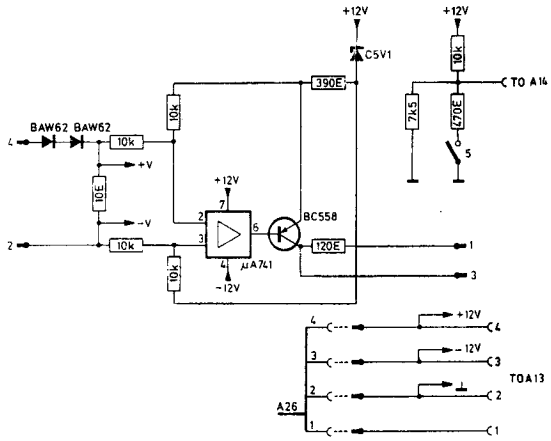
Spring 9009

When fitting spring 9009 in the bracket 9007, **always** mount the spring in the middle hole.

ELECTRICAL ADJUSTMENT
Laser power supply

Since the light pin is very sensitive to static charges, care should be taken that during measurements and adjustments of the laser power supply the potentials of aids and yourself equal the potential of the CD mechanism.

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk



Check

The laser simulator PCB 3634028 should be used here.
Take the flex PCB out of socket A11 and connect the switch simulator PCB with the socket.
Remove plug A13 and insert it in the socket on the simulator PCB.
Connect the plug with 4 wires to socket A13. Take out plug A14 and insert the plug with 1 wire in socket A14.

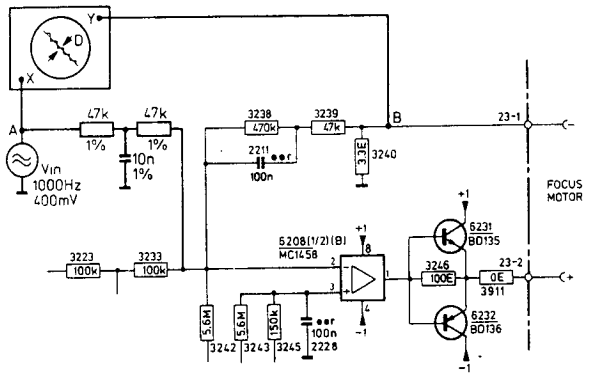
Set the switch on the simulator PCB in the OFF position and the mains switch in the ON position.
Turn trimming resistor 3140 clockwise (max. R) and measure the voltage between points +V ad -V on the simulator PCB.
The voltage should be $\leq$15 mV.

Check of laser supply control:
Set the switch on the simulator PCB in the ON position and measure the voltage between points +V and -V on the simulator PCB.
Resistor 3140 clockwise (max. R):
U +V -V = 225 mV ±45 mV.
Resistor 3140 counterclockwise (min. R):
U +V -V = 750 mV ±150 mV.
Set resistor 3140 in mid-position.
This is a preliminary adjustment. After the simulator PCB has been removed the laser current must be adjusted.

Adjusting the laser supply

Play track 1 of test disc 3634031 (disc without defects).
Connect a DC voltmeter across resistor 3308 on the servo PCB (= on emitter of transistor 6239 and ground).
Adjust the laser power supply with resistor 3140 until the voltage across resistor 3308 is 575 ±75 mV.

Adjusting the focus bandwith



Make a measuring arrangement according to the figure. Play track 1 of test disc 3634031 (disc without defects).
Adjust trimming resistor 3138 on PRE.AMPL. + LASER PCB for a 180° phase difference between signals A and B.
This corresponds with a minimum distance D in the Lissajous pattern.

R = 47 kΩ - 1%
C = 10 nF - 1%

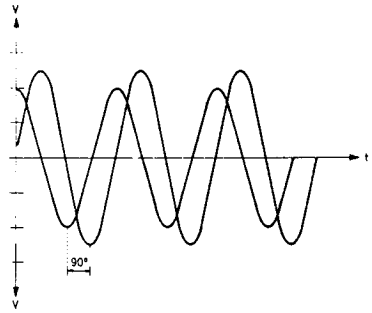
Focus offset

Trimming resistor 3132 should be i mid position.

Motor-control check (Hall)

1. Disconnect the wire from PRE.AMPL. + LASER PCB to connector A18 pin 4 on the Hall motor control.
2. Connect channel A of a dual-beam oscilloscope to the emitter of transistor 6082, 6083 and channel B to the emitter of transistor 6084, 6085.
   Position of oscilloscope: 2 V/div - 10 ms/div.
3. Switch the set on.
4. Apply a *negative* voltage to pin 4 of connector A18.
   The voltage may *not* be applied until *after* the circuit has been connected to power supply voltage. Start from 0 V and slowly proceed to -5V. Now the motor should run.
   When the motor runs the voltage can be brought to approx. -2.5 V.
   The motor should continue to run then.
5. The oscilloscope should display sinusoid signals now (see fig. A).
   After approx. 2 s they should lie symmetrically round the 0-axis and be shifted 90° relative to each other.
   The maximum ratio of the amplitudes of these 2 signals is allowed to be 1:2.
6. The amplitude depends on the applied voltage.
   The V-in/V-out pp ratio should lie between 1:2 and 1:3.
7. Determine at which V-in the motor runs at 600 rpm.
   At 600 rpm the frequency of V-out is 30 Hz.
   At this speed V-in should lie between -1.5V and 3.7V.

Conclusion:
When all these conditions are present motor and PCB may be considered on order.
If points 4, 5 and 6 are not correct, the fault should most probably be found in the electronics.
If points 4, 5 and 6 are correct and the voltage to be applied at point 8 is e.g. -4.5 V to obtain a motor speed of 600 rpm, there will most probably be something wrong mechanically E.g. the bearing friction is too high.



Check of the AGC and offset circuits

(See SERVO PCB).
Play track 1 of test disc 3634031 (Disc without defects).
The voltage between pin 1 of IC6212 and ⊥ should be –4 V ±2 V.
The voltage between pin 14 of IC6215 and ⊥ should be –2.5 V ±2V.

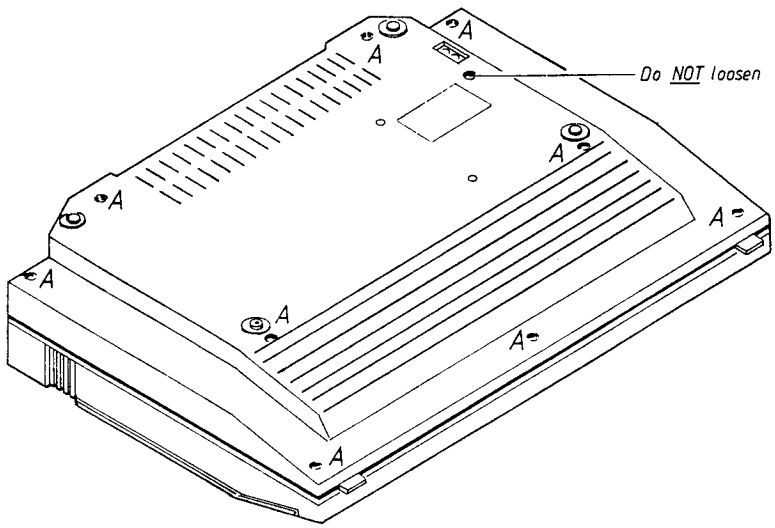
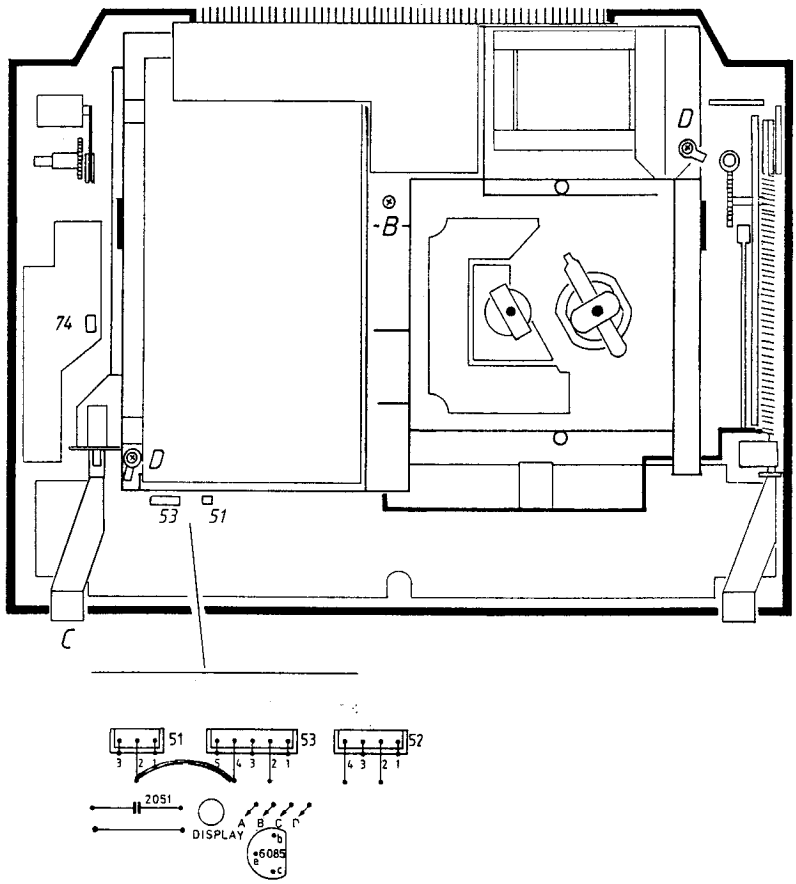
DISMANTLING
Bottom



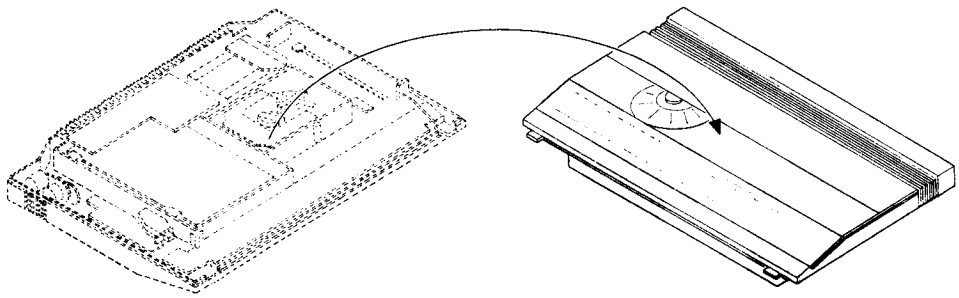
Remove the screws A.

Top plate

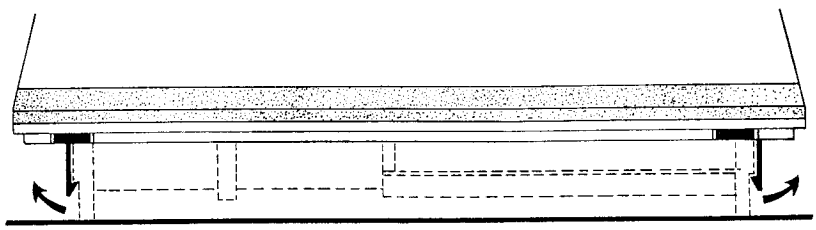


Top Plate
Remove the screw B.
Remove the PLAY button C.
NB! The ON/OFF switch must be in position OFF when removing the button in order to avoid damaging the switch.
Remove the two ground connections D.

Remove plug 74 on the lid motor control PCB.
Then introduce a short-circuit from socket 53 pin 4 to 51 pin 1 ground on the control and display PCB.
NB! When plug 74 is removed and a short-circuit has been introduced between 53 pin 4 and ground, the dust cover functions cannot be operated.

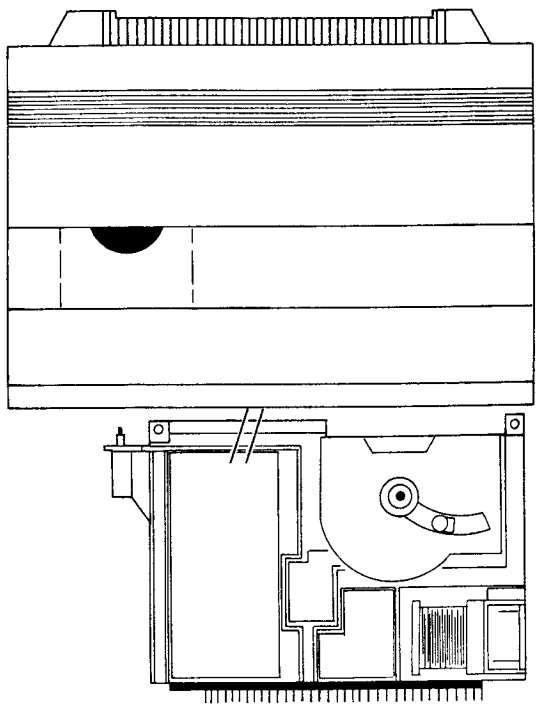


Turn over the set while supporting the chassis frame.



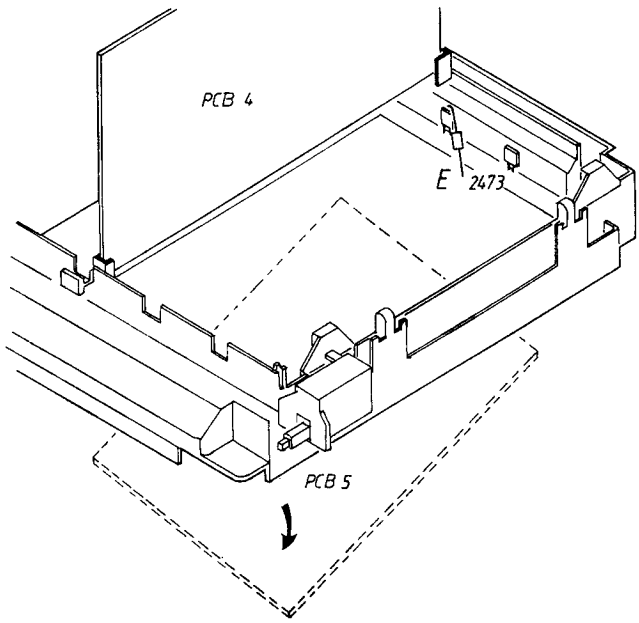
Tip out the two plastic tags.
Carefully lift off the top plate.
NB! Be aware of the cable connection between the top plate and the chassis frame.

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk



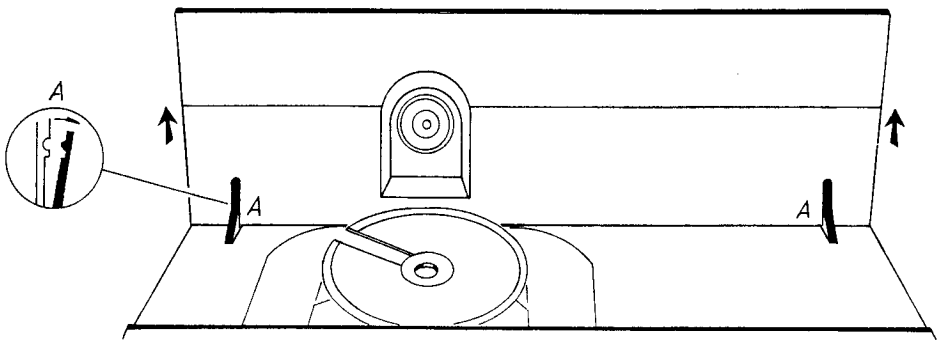
Place the top plate in front of the chassis frame as illustrated.

PCB4 and PCB5.



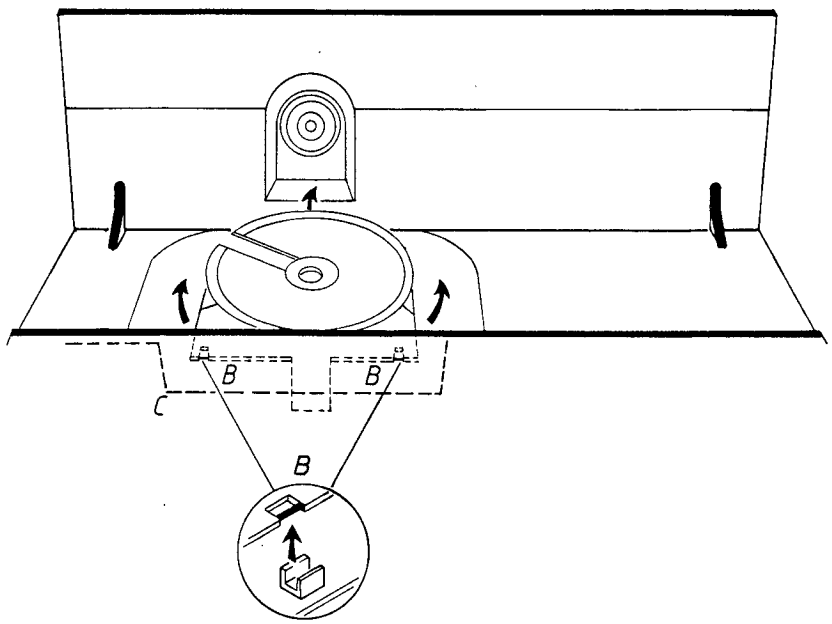
Tip up PCB4 and place in service position.
PCB5 cannot be tipped up until the capacitor E is desoldered.

Replacement of dust cover



Tip out the hinges A in both sides as illustrated.
The dust cover my now be pushed upwards.

Replacement of disc platter



Lift out the disc platter from the two clips B.
Pull the disc platter towards the dust cover. It is thereby disengaged.
NB! When mounting the disc platter, the tounge must be placed under the eject bar.

SERVICE TIPS

In order to prevent loose metal objects from getting in the CD mechanism it will be necessary to see to a clear repain station.
Before the player is being used or service, the transportation screws should be removed.
These screws have to be reapplied after servicing.

Ensure that the player is not resting on the shaft of the turntable motor or the light pin during repairs and measurements.

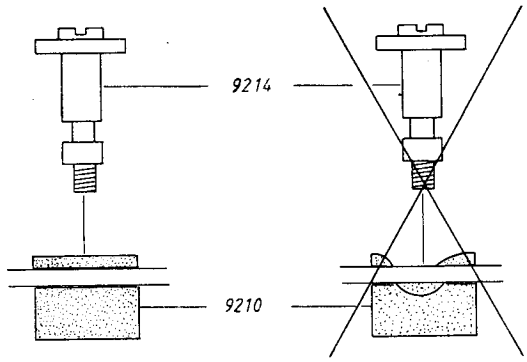
The player consists of various MOS ICs. Since MOS ICs are generally very sensitive to overload and overvoltage, servicing operations should be performed with the utmost care.

In the player chip components have been applied. For insertion and removal of chip components see page 2-1.

When the top part with the lid mechanism has to be demounted for repair, a loose hold-down should be employed.
Part no. for the disc hold down is 3634032.
For normal function of the set, when the top part is demounted the lid on the top part have to be closed.

Rubber bushing

For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk



When replacing rubber bushings (pos. 9210) make sure the rubber is not stuck in the hole in the chassis.

Mechanism

Servicing the Radial and Focusing unit pos. 9409.

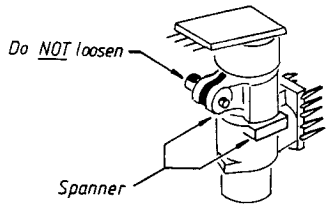
- Take the two flex PCBs out of the connectors on the preamplifier PCB.
- Disassemble the *defective* RAFOC unit by removing the 4 bolts no. 7 and shaft item number 9411.
- Remove shaft item number 9411 of the new RAFOC unit.
  Pay attention to the 3 intermediate washers item number 20 and spring washer item number 21 they should assume the same positions after assembly.

Mount the Radial and Focusing unit.

- Loosen the 4 bolts no. 7 until the bottom plate can be removed.
  Do not remove bolts no. 7 (they hold the new Radial and Focusing unit together).
- Mount the new Radial and Focusing unit on frame 9410.
  Ensure that the 3 intermediate washers 20 and spring washer 21 are positioned correctly before fixing shaft item number no. 7.
- Check that the arm moves freely and the angle setting as well (see check and possible adjustment of angle setting).

Replacing light-pin

– For replacing the light pin it is not necessary to remove the Radial and Focusing unit.



For Service Manuals Contact
MAURITRON TECHNICAL SERVICES
8 Cherry Tree Rd, Chinnor
Oxon OX9 4QY
Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk

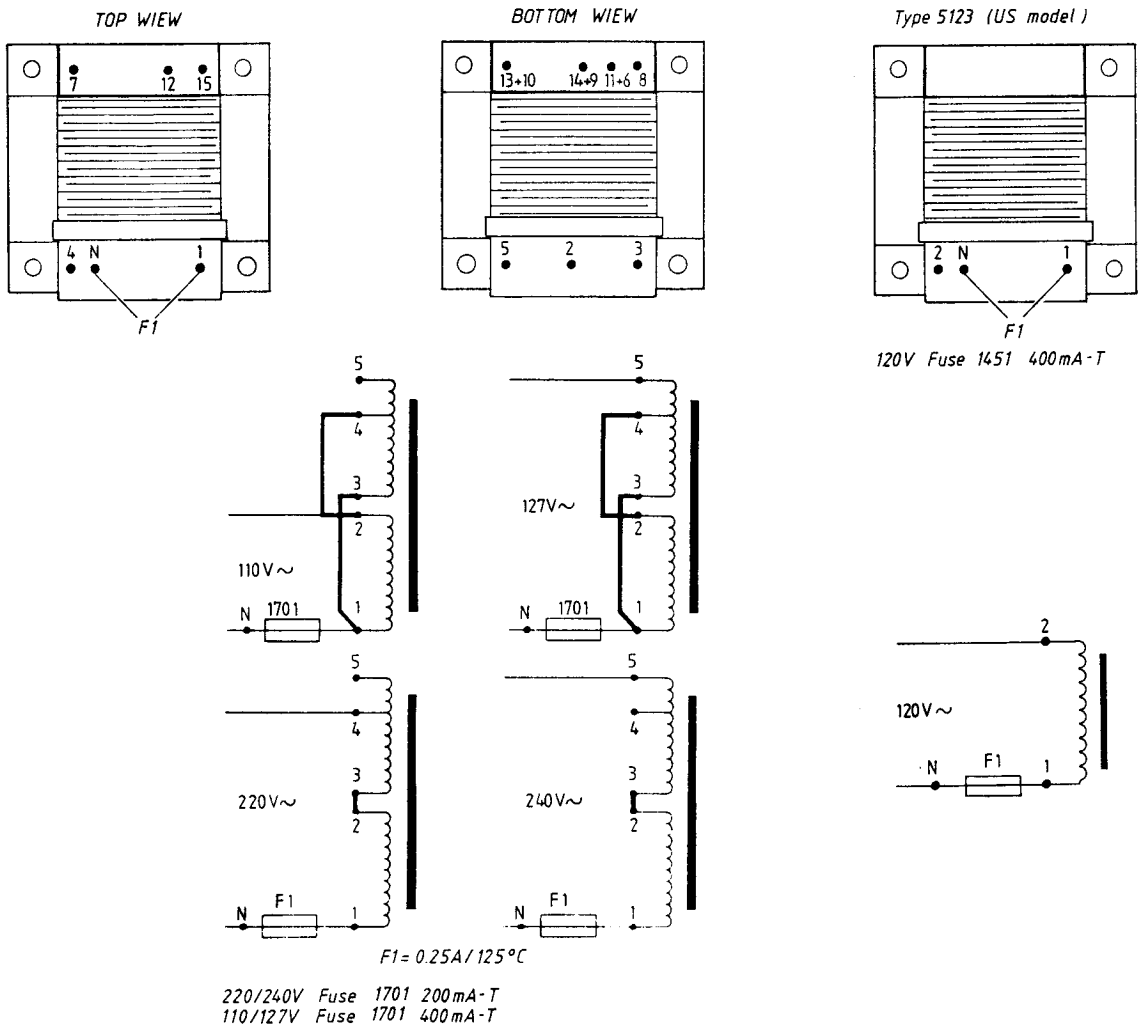
The light pin can be removed by turning it anticlockwise by means of an open-ended spanner of 12 mm and afterwards pulling it out of the arm. During mounting, the light pin must be pushed into the arm as far as possible, and turned clockwise.

The CD-mechanism is provided with self-lubricating beariings and should thus not be lubricated.

Attention:
To prevent adjustments from changing, no screws other then those mentioned above should be loosened.

The light pin is much more sensitive to static charge than a MOS IC. Careless treatment during servicing may reduce life expectancy drastically. For this reason care should be taken that during servicing the potentials of the aids and yourself equal the potential of the mechanism.

Mains Transformer Wiring



INSULATION TEST

Each set **must** be insulation tested after having been dismantled. The test is to be made when the record player has been reassembled completely and is ready for delivery to the customer (with the transis screws tightened).

Make the insulation test as follows:

Short-circuit the two pins of the mains plug and connect one of the terminals of the insulation tester.

Set the mains switch in position ON.

Connect the other terminal of the insulation tester to one of the two screws placed on the heat sink on the back of the unit.

NOTE!
To avoid ruining the set it is essential that both insulation tester terminals are in really good mechanical contact.

Now slowly turn the voltage control of the insulation tester until a voltage of 15.-2 kV is obtained. Hold it there for 1 second, then turn the voltage down again.

At no point during the testing procedure any flashovers are permissible.

TROUBLE SHOOTING GUIDE
CDX

General checkpoints

In the detailed troubleshooting method which follows a number of general conditions, required for proper functioning of the player, will not be repeated.
Before starting the detailed troubleshooting method these general points should be checked.

a: Ensure that disc and objective are clean (remove dust, fingerprints, etc.) and use undamaged discs.

b: Check whether all power supply voltages are presents and have the correct level.

3538642 03-86 TO PAST INTO SERVICE MANUAL: BEOGRAM CDX 3538625

TROUBLE SHOOTING GUIDE FOR BEOGRAM CDX

no

yes

Before starting trouble shooting, place the CD in service position

Place a compact disc in the player and press play:

1.
Lid closes? → Check all switches - OK? → Repair switches

Check that 6IC6078 pin 24 goes high and pin 25 stays low → Check control and display circuit

Check motor control circuit (PCB8), and lid mechanism

For Service Manuals Contact

Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk

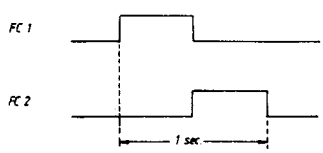
2.
Disc starts turning? → Does laser emit light? → Does 4IC6202 pin 6 supply a low level? → Check functions around 4IC6202, 4IC6201, control and display circuit

Does laser emit sufficient light? (see service man. page. 5-1) → Check laser supply unit. (PCB 02) Check laser.

Is laser angle correct in relation do disc? (see service manual page 4-2).

REMOVE COMPACT-DISC. PRESS PLAY.

Note if laser moves up and down approx. 3 times. Does the laser move? → Does 4IC6202 pins 12 and 13 supply the pulses shown? → Check functions around 4IC6202



Does voltage on E of 4TR6231/32 vary between approx. ±5V? → Check focus servo output (PCB 04)

↓

Check focus mechanism. Check connection between focus servo output and focus coil.

PLACE COMPACT DISC IN PLAYER AGAIN PRESS PLAY

Does 4IC6205 pin 2 supply the pulse shown? → Does the focus error signal level change? (Plug 24-4 PCB 04) → Check output from 2IC6101 and laser diodes

FN 
↓

Check voltages around 4IC6205.

Does FCO 4IC6202 pin 14 go low? → Check functions around 4IC6202 and 4IC6201.

Does 5IC6510 pin 4 supply a pulse with time constant of 136 µS? → Check 5IC6510

MCES

Tel:- 01844-351694 Fax:- 01844-352554
Email:- enquiries@mauritron.co.uk

Is MCES signal also present in 4R3261? → Check voltage around 4IC6205.

Measure voltage on E of 4TR6233. Voltage must be between -1.5 and -2.5V. → Check motor stop circuit (PCB 07). Check turntable motor amplifier (PCB 04)

Check hall motor (see service manual page 5-2)

CAN ONLY BE MEASURED WHILE COMPACT DISC TURNS

IF DISC STOPS TURNING, ACTIVATE PLAY AGAIN

3.

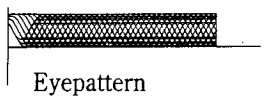
COMPACT DISC STARTS TURNING

(In some cases the disc stops again)
Do green digits light?

→ Can an eyepattern signal (approx. 1 Vpp) be measured in test point 65 (5IC6501 pin 7)?

→ Does laser move towards center of disc when starting up? (lead in area)

→ Check radial servo output (PCB 04).
Check control signals for radial start up, e.g. µDAC, RDIR, and RCO 4IC6211.
If OK



Eyepattern

Check h.f. amplifier

Do HFLS, HFL and $\overline{DO}$ (5IC6508) go high?
If no constant high signal is measured it is probably due to radial servo circuit being defective.

→ Try manually to lead laser to spot on the disc where there is certainly a signal. Hold laser around this spot while simultaneously measuring HFLS (5IC6508 pin 1): Is it now possible to measure pulses on HFLS. If not, check drop-out HF level detector (PCB05).

Email:- enquiries@mauritron.co.uk

Does $\overline{RCO}$ (4IC6211 Pin 9) go high? Must remain constantly high.

→ Check automatic gain control and offset control, as follows:
Measure voltage on pin 14 of 4IC6215, voltage must be –2.7V ±2V.
If this is kept the offset control circuit is declared OK.
If not check offset control.
Measure voltage of pin 1 of 4IC6212 to be -4.3V ±2V.
If this is kept the automatic gain control circuit is declared OK.
If not, check gain control.
If voltages are measured in both circuits beyond the tolerances indicated, faults must be found in circuits with influence on both control circuits, e.g. 650 Hz OSC or servo signal paths loop.

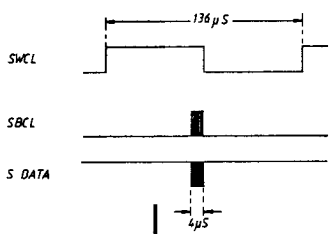
Does P-data (5IC6501 pin 5) go low?

→ Is the PLL circuit locked in? (5IC6501 pin 22 must change from approx. 1.8MHz in stop mode to 4.3 MHz in play mode).

→ Check eye-pattern Check functions around 5IC6501.

Check functions around 5IC6501.

Are Q-data transmitted from 5IC6501 pins 2, 3, 4 to 4IC6201 pins 26, 27, 1?



→ Check functions around 5IC6501, 5IC6504, 4IC6201.

Check functions around display IC (6IC6078)

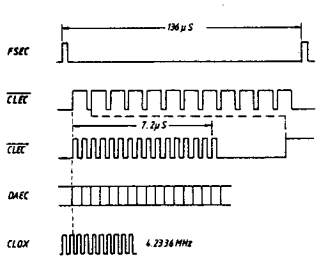
In order to see the signal sequences in an oscilloscope it is necessary to trigger on the signal shown at the top of the oscillogram.

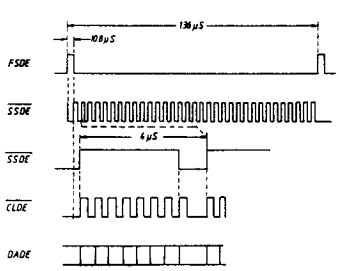
The signals within each oscillogram must synchronize in order to consider the signal communication between the IC's to be OK.

Is signal present on the output of CD player?

→ Is the UNEC flag between 5IC6510 and 5IC6514 low? (Data from ERCO to CIM OK?)

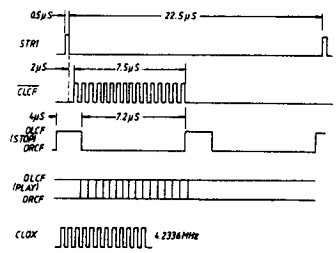


→ Check data transmission between DEMOD and ERCO. Are they OK?

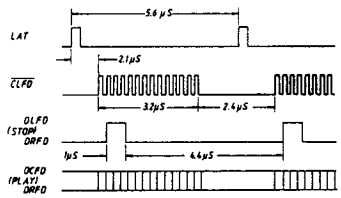


Check data transmission between ERCO/RAM.

Check data transmission betweem CIM and FIL. Are they OK?



Check data transmission between FIL and DAC. Are they OK?



Check functions around analogue output
